SPECIAL BULLETIN NO. 08-17

RESIDUAL MARKET LOSS RATIO AND BURDEN ESTIMATE

The policy year (PY) 2016 Residual Market Burden, estimated as of the first quarter of 2017, is 2.04%. This burden was calculated using the following data, valued as of March 31, 2017. The loss ratio was estimated by the Massachusetts Workers' Compensation Assigned Risk Pool Reserving Committee.

- The Loss Ratio is 71.0%;
- The Expense Ratio is estimated to be 37.05% of written premium;
- The policy year 2016 Servicing Carrier Written Premium is estimated to be \$123,432,000;
- The estimated Voluntary Assessable Premium that is being used to determine shares of the PY 2016 Massachusetts Reinsurance Pool is \$487,413,178; and
- A factor of 1.00 is used since a VDAC Reapportionment has not yet been performed on PY 2016.

The PY 2016 estimated Residual Market Burden was determined as follows:

$(\text{Loss Ratio} + \text{Expense Ratio} - 1.00) \times \frac{\text{Servicing Carrier Premium}}{\text{Voluntary Assessable Premium}} \times \text{VDAC Factor} = \text{Residual Market Burden}$

$$(.71 + .3705 - 1.00) \times \frac{123,432,000}{487,413,178} \times 1.00 = 0.0805 \times 0.2532 \times 1.00 = 2.04\%$$

Similarly, the PY 2015 Residual Market Burden, estimated as of the first quarter 2017, is 2.18%, assuming a Loss Ratio of 73% and a VDAC Reapportionment factor of 1.00.

The residual market burden is a measure of the pool-related cost that pool members incur when writing assessable voluntary business. For example, a positive burden of 10% indicates that an insurer will incur ten dollars of pool-related obligations for every one hundred dollars of voluntary assessable premium written. By comparison, a burden of -5% indicates that a pool member will earn a profit of five dollars for every one hundred dollars of voluntary assessable premium written.

Note that burden estimates do not take into account those policies serviced by Voluntary Direct Assignment Carriers (VDACs). VDACs assume the underwriting results of policies assigned to them.

Exhibit 1 shows the currently estimated burden for policy years 2007 through 2016.

Exhibit 2 shows the currently estimated loss ratios, expense ratios and pool shares used to calculate the burdens for policy years 2007 through 2016.

Exhibit 3 is a graph that provides historical estimated burdens for policy years 2007 through 2016. Burden estimates may change over time because estimated loss ratios are subject to change as loss experience matures.

The residual market burdens shown in Exhibits 1, 2 and 3 ignore the time value of money, in effect assuming an interest rate of 0%. The chart in Exhibit 4 includes, solely for informational purposes, estimates of the net present values of the residual market burdens using various discount rate assumptions.

Notes:

A VDAC Reapportionment has not yet been performed on PY 2016, so a factor of 1.00 is being used.

An optional Intermediate VDAC Reapportionment is not being performed on PY 2015.

Applying the Final 2014 VDAC Factor of 0.9957 caused the 2014 Est. Pool Burden to change from 1.97% to 1.96%.

Applying the Final 2013 VDAC Factor of 1.03 caused the 2013 Est. Pool Burden to change from -1.11% to -1.14%.

A VDAC Factor greater than one adjusts for over-assignment of residual market premium to the VDAC carriers relative to their final participation ratios. Similarly, a VDAC factor less than one adjusts for under-assignment of residual market premium to the VDAC carriers relative to their final participation ratios.
